How to put R code into the appendix

me

November 7, 2022

1 Question 1

This is how to list your code in an appendix, and yet use it in the main document.
The first part requires you to define your functions, but set the option echo to
FALSE so that the code function does not appear here.

You can then use the function in the main part of the document.

```
f(10)
```

```
## [1] 20
```

A Code for Question 1

Then to add the code in the appendix, create an empty chunk with the same name as the chunk name used to define the function. If you want, you can also add eval=FALSE, so that the code is not executed again.

```
f = function(x) {
  x * 2
}
```
